Integrated Flood Management Concept Paper

|

Description / Abstract

Integrated flood management (IFM) calls for a paradigm shift from the traditional, fragmented and localized approach, and encourages the use of the resources of a river basin as a whole, employing strategies to maintain or augment the productivity of floodplains, while at the same time providing protective measures against losses due to flooding. Since IFM is essentially a dynamic notion, the perception presented in this third revised edition also includes a number of emerging issues, such as risk management, urban floods, climate variability and change, and adaptive management.

Publication year

2009

Publisher

World Meteorological Organization - WMO Associated Programme on Flood Management - APFM

Keywords

Integrated Flood Management Integrated Water Resources Management (IWRM)
