

# Gender, Water and Climate Change

١

## Author(s)

Fajber, Liz

## **Description / Abstract**

Climate change is a reality, and poses a serious long term threat to society and to the environment. Water is particularly threatened by climate change. With rising temperatures, changes in runoff patterns and increased water evaporation, climate change will greatly affect the distribution of the world's water and the timing of flows. Such challenges of climate change are not gender neutral. Women and men have different vulnerability and capacity to adapt to climate impacts due to differing roles, opportunities, and access to resources. This folder gives an overview of key challenges and concludes with recommendations for policy and practice.
